05/94/52, 1 Apr 52.

DESCRIPTORS: Tungsten. Electrolytic polishing.  
Ductility, Brightness.

The use of an electrolyte with brightening effect, and of direct current, has demonstrated that an increase in the ductility of tungsten shapes can be achieved in the same manner as with the use of a sodium nitrate solution and with alternating current. The increase in ductility is retained after a 15 minute period of annealing at temperatures up to 1350° C. The surface

Trans. of Metallwirtschaft [Metallwissenschaft, Metall-  
technik] (Germany) 1946, v. 19, p. 1029-1033.

DESCRIPTORS. \*Aluminum, Degassing, Sound,  
Ultrasonic radiation, \*Aluminum alloys, \*Magnesium  
alloys.

Two different avenues of approach were taken in the  
test program. Externally generated sound waves were  
introduced into the melt by means of suitable resonant  
agents. The vibrations were generated within the melt  
itself by relying on the ponderomotoric action between  
alternating currents of sonic frequency and a static  
magnetic field. The shortest degassing periods were  
(Metallurgy--Light Metals, TT, v. 9, no. 10) (over)
